

1 Text

This is a template on text. You can add text anything like this which will show up in the PDF after compile.

1.1 Subsection

This area for subsection of the previous text. You need to add one or more subsection.

2 Coloured Text

The colour of text can also be **easily** set. To print in text in red color you can use: `\textcolor{red}{Red color Text}`

3 Itemized Text

Here you need to add some text in bullet list.

- First Item
- Second Item

3.1 Ordered List

This section for text in a particular order.

1. First Item
2. Second Item

4 Special Characters

1. Commands start with a backslashn \.
2. A percent sign % starts a comment. LATEX will ignore the rest of the line.
3. Superscript and Subscript:

$$a_1^2 + a_2^2 = a_3^2$$

To write this we need to write as follows: `n[a_1^2 + a_2^2 = a_3^2 n]`

4. The following characters play a special role in L^AT_EX and are called "special printing characters", or simply "special characters": # \$ % & ~ _ f ^ g Whenever you put one of these special characters into your file, you are doing something special. If you simply want the character to be printed just as any other letter, include a backslash (\) in front of the character. For example, `n$` will produce \$ in your output.
